Leidos SeeIT

Customers need real-time visibility into their enterprise and easy access to the information that is most important to them. The SeeIT portal is a collaboration platform used to communicate effectively; provide situational awareness; facilitate program management and execution; gather metrics; and monitor program performance, quality, and risks.

SeeIT provides customers with a common tool to access near real-time information—providing users with actionable data to support rapid and informed decision-making. SeeIT provides role-based transparency to executive leadership, management, security, operations staff, and other stakeholders.

OUR APPROACH

SeeIT is based on an open source framework powered by the Leidos Enterprise Architecture Framework (LEAF). This technology enables us to rapidly create and update dynamic portal and dashboard views from underlying data sources and allows end-users to easily customize their experience and see actionable information that is important to them. The LEAF-based portal includes an object-oriented library of widgets (which are defined as active components of the portal interface that enable users to perform a function or access a service) that dynamically refresh as the underlying data sources are updated.

OUR CAPABILITIES

› Serves as an enterprise-level information sharing portal/dashboard and collaboration tool

› Provides enterprise visibility and real-time information to improve decision making

› Allows users to easily see service availability and performance against SLAs/KPIs and quality standards

› Provides widget-based information views that are easily tailorable by the end user; widgets link to underlying data sources which are updated in near real-time

› Enables users to drill down to foundational data in no more than three clicks

› Displays applicable content based on user role, and allows multiple levels of information access (including for other contractors and outside stakeholders)

› Enabled for single sign-on

› Can flexibly deploy into existing customer environments (cloud or on-premise infrastructure)

› No license or royalty fees

FEATURE	BENEFIT
Aggregates and visualizes data	Allows users to access one application for up-to-date information
Provides real-time information to enable data-driven decision making	Refreshes dashboard display as underlying data is updated Informs customer of real-time program status Provides near-real-time data on system/service availability and performance against SLAs/KPIs Enables rapid resource prioritization and task escalation by delivering enterprise-level visibility with drill-down capabilities to determine root causes
Customizable	Widget-based framework allows users to easily "drag-and-drop" widgets to customize their dashboard (easy to add, move, resize, remove) Allows users to see the information important to them Enhances security while providing targeted data and control for each role Provides role-based access to information and widgets
Saves time and money	Reduces costs while also avoiding vendor lock-in and providing interface flexibility Leidos developed framework is based on open source technology, thus avoiding licensing costs

PROVEN SUCCESS

The SeeIT portal is a result of Leidos' corporate innovation initiatives. SeeIT is powered by our Leidos Enterprise Application Framework (LEAF), in use by Leidos since 2009 on dozens of customer programs, including government agencies and specific branches of the U.S. Military—which reduces risk to customers because it has been used successfully on programs since 2009.

- ▶ Effectively aggregates and visualizes data, which reduces the number of applications a user has to interface with by up to 80%
- ▶ The enterprise visibility provided by SeeIT allows for rapid resource prioritization and task escalation and enables 83% faster informed real-time decision making (going from hours to seconds)

WHY PARTNER WITH LEIDOS?

Organizations need collaboration, visibility, and easy access to information to effectively manage programs. SeeIT helps our customers effectively communicate by increasing situational awareness, facilitating program management, and enabling success.
