

# BIOMETRIC SOLUTIONS FOR AN IDENTITY-DRIVEN WORLD

Completing personal transactions increasingly depends on positive identification, but traditional forms of ID can be stolen or forged. Biometric matching — verifying a person's identity through unique biological characteristics such as fingerprint, face or iris — provides more reliable identification than traditional documents.

**WITH BIOMETRICS, INDIVIDUALS CAN MORE SECURELY AND EFFICIENTLY:**

After an initial enrollment and biometric scan, anyone can unquestionably prove their identity with a touch of the finger or a glance at a sensor. Low implementation costs make this convenience attractive to a wide range of government and commercial identity-driven services.
